

Migrating legacy systems

Early adopters of document imaging systems could possibly have many millions of documents stored in a system which now needs upgrading or migrating to modern ECM platforms. iiCon can help you to protect that investment, we have developed an “Extractor-Committer” tool that provides a tried and tested method of converting images and data from one system to another.

Our content Migration Service includes a review of the current storage methods, indexing structures and file formats. We establish what mechanisms the current system has for exporting data and images, what the new indexing scheme will be, the preferred image format and storage location.

Once the above has been agreed we configure our “Extractor-Committer” application and run sample data through it prior to setting up the production system. The process can be run as a background task and the time taken to transfer the data and images will be dependent upon processor power and capacity. A full audit trail is maintained throughout the migration process and iiCon provides assistance in resolving any exceptions that may arise.

iiCon has recently performed major content migrations for HBOS, Hibernian Insurance, Royal Bank of Scotland and Vodafone.
